The prevalence of allergic diseases has increased dramatically over recent decades, both in terms of the number of sufferers and the number of allergies. This is a trend that has frequently been referred to as 'the epidemic of the 21st century'. As described in ancient texts, allergies have been known for over 2,000 years, but the term 'allergy' was only coined at the beginning of the 20th century when doctors began to understand their pathophysiological basis. This book presents a detailed and varied historical overview of the field of allergology. Beginning with insights on allergy from antiquity to the 20th century and the development of the associated terminology, it compiles historical reflections on the understanding of the most common allergic diseases. Important milestones in the discovery of mechanisms of allergy are described, followed by historical accounts of the detection of allergens such as pollen, dust mites, peanuts and latex, and of environmental influences such as pollution and the relationship between farmers and their environment. Several chapters illustrate the progress made in allergy management to date. Particular highlights of this book are the personal reflections of and interviews with a number of pioneers of allergy, including F. Austen, J. Bienenstock, K. Blaser, A. de Weck, A.W. Frankland, K. Ishizaka, and many more. Concluding with portrayals of allergy societies and collections, as well as being supplemented by two films, this book represents a veritable treasure trove of fascinating and richly illustrated information. Not only researchers, physicians and medical historians, but also students and even non-scientists will find History of Allergy a scientific adventure well worth reading.

Allergy and Allergen Immunotherapy: New Mechanisms and Strategies is a valuable and comprehensive book that covers allergy and causative allergens and provides diagnostic and therapeutic aspects as well. With chapters from internationally recognized experts in the field, the book provides a balanced approach to enumerating pollen allergens as well as allergy diagnosis and therapeutic management and safety assessment of genetically engineered food allergens. The book features a special section on allergic diseases and allergens from tropical countries, including such countries such as India, Sri Lanka, Iran, and South Korea, giving the book a global appeal. The book is broken in the following sections: Epidemiology, Pathophysiology, and Diagnosis of Allergy Aerobiology and Allergic Diseases Pollen Allergy in the Tropics and Temperate Regions Allergy in Children Food Allergy Evaluation Allergen Immunotherapy and Anti IgE The book deals not only on basics of allergy and allergen immunotherapy but also discusses indoor environments and safety considerations of genetically modified food allergens. The first of its kind volume from the Indian subcontinent that caters to the needs of clinicians, aerobiologists, environmentalists, and regulatory agencies as well, the volume will be of immense interest for clinicians and patients of allergy as well as diagnostic and therapeutic management of allergy in tropics.

Respiratory diseases are the pathological conditions that affect the tissues and organs of the respiratory system such as the upper respiratory tract, pleura and pleural cavity, alveoli, bronchi, bronchioles, trachea, the nerves and muscles of breathing. Allergic respiratory diseases are caused due to exposure to an allergen. Asthma is a common allergic respiratory disease affecting nearly 300 million people worldwide. It is an inflammatory disease of the airways of the lungs, and is

characterized by recurring symptoms like airway obstruction and bronchospasm. Avoiding exposures to allergens and irritants, inhaling corticosteroids and use of long-acting beta agonists are the chief strategies for the management of asthma. Sinusitis is another respiratory disease that can be caused by allergies. It is strongly correlated to asthma. The condition allergic fungal sinusitis occurs in people with nasal polyps and asthma. Allergic respiratory diseases are diagnosed by performing a blood test, chest X-ray, biopsy of the lung or pleura, bronchoscopy, etc. Several medications may be used to block allergic mediators and their actions, such as antihistamines, epinephrine, glucocorticoids, etc. This book brings forth some of the most innovative concepts and elucidates the unexplored aspects of allergic respiratory diseases. It includes some of the vital pieces of work being conducted across the world, on the causes, symptoms and treatments of such conditions. Those in search of information to further their knowledge will be greatly assisted by this book.
